

Test design:

Asked users to create a document and save it, try formatting options within the text editor, navigate between tabs on the app, and read through user documentation.

Who we asked to test:

Ashley Rollins (family not in CS), Shawna Heiser (Client), Olivia Aamodt (friend not in CS)

What occurred:

User behavior across all tests indicated issues with formatting. With Olivia and Shawna, they both seemed confused about how to work with the general note section and SOAP section since they weren't using one or the other consistently. Ashley was concerned because their work does not save when switching tabs.

What we learned:

We learned copy paste with formatted text did not work in the syncfusion docs editor, user docs needed updates, could possibly remove SOAP notes tab from app

What we changed as a result:

Switched from syncfusion to React Quill for the general notes section, updated user documentation to more accurately represent the state of the app

What did you as a group learn as a result of your respective user testing?

We learned about a major bug (paste issue), possible formatting issues with the app, and that we needed to update the user documentation. We also learned that it is good to observe the client's regular workflow near the beginning so that in the future, we could have prevented doing all the work on the syncfusion editor that doesn't do a core function that our client wants.

Compare differences between: peer feedback, independent user feedback, and client feedback.

Olivia, one of our independent user tests, was very impressed with the functionality and formatting options like bullet points and how simple the SOAP sections are to type in and use. She also used the app how we expected a user to use it; by typing in each box and saving that file from there. Our client Shawna had a very different workflow in which she first copied patient notes from Google calendar taken previously and then tried to paste them in the app expecting them to be auto formatted in SOAP sections.

What changes to the UI or User Documentation will you make as a result of the feedback you received?

Possibly remove the SOAP notes tab on the app (will ask for more client feedback), will add a pop up message to make sure client knows their work will not save if switching tabs, and we already made changes to the user documentation as a result of user feedback.

What user-test issues did your group elect NOT to address? What was the reasoning?

Shawna expected the saved file to be formatted like how ChatGPT formats her notes such that it rephrases her words to better describe each requirement of SOAP. We did not address this because the scope of our project is too small. Also, with one sprint left, it would be very difficult to implement an autoformat, AI type of functionality.
